

CARBON STEEL GLOBE VALVE WITH BELLOW PN40

Certificate 3.1

Size : DN 15 to DN 200
Ends : Flanges R.F. PN40
Min Temperature : - 20°C
Max Temperature : + 400°C
Max Pressure : 40 Bars
Specifications : Non rising stem
Bolted bonnet and gland pack
Stainless steel bellow

Materials : Carbon steel ASTM A216 WCB

CARBON STEEL GLOBE VALVE WITH BELLOW PN40
SPECIFICATIONS :

- Respect the flow direction indicated by the arrow
- Non rising stem
- Bolted bonnet and gland pack
- Stainless steel bellow
- Pressure equalizing plug in DN200
- Pressed seat in the body
- Anti-turn device to avoid the risk of torsion of bellows
- Flanges R.F. PN40
- RAL 5002 blue painting, 40µ thickness

USE:

- No corrosive or no toxic fluids, steam, hydrocarbons, thermic fluid
- Min and max Temperature Ts : - 20°C to + 400°C
- Max Pressure Ps : 40 bars (see graph under)
- Δp 20 bars max for DN125, 15 bars max for DN150, 19 bars max for DN200
- Keep greased the stem

CARBON STEEL GLOBE VALVE WITH BELLOW PN40**INSTALLATION INSTRUCTIONS****GENERAL GUIDELINES :**

- Ensure that the valves to be used are appropriate for the conditions of the installation (type of fluid, pressure and temperature).
- Be sure to have enough valves to be able to isolate the sections of piping as well as the appropriate equipment for maintenance and repair.
- Ensure that the valves to be installed are of correct strength to be able to support the capacity of their usage.
- **Installation of all circuits should ensure that their function can be automatically tested on a regular basis (at least two times a year).**

INSTALLATION INSTRUCTIONS :

- **Before installing the valves, clean and remove any objects from the pipes** (in particular bits of sealing and metal) which could obstruct and block the valves.
- **Ensure that both connecting pipes either side of the valve (upstream and downstream) are aligned (if they're not, the valves may not work correctly).**
- **Make sure that the two sections of the pipe (upstream and downstream) match, the valve unit will not absorb any gaps. Any distortions in the pipes may affect the tightness of the connection, the working of the valve and can even cause a rupture.** To be sure, place the kit in position to ensure the assembling will work.
- **If sections of piping do not have their final support in place, they should be temporarily fixed. This is to avoid unnecessary strain on the valve.**
- Tighten the bolts in cross.
- It's recommended to operate the valve (open and close) 1 to 2 times per year
- Tighten the gland packing at the first start of the installation (with a moderate torque) so that there's no leakage and the handwheel is easy to operate.
- Do not use tools to operate the handwheel
- Respect the flow direction indicated by the arrow
